

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

flesh. For many of the migratory species detailed records are given of the spring arrivals. The list is thus a welcome addition to an exact knowledge of bird distribution in Pennsylvania. — J. A. A.

Grinnell on the Birds of Santa Barbara, San Nicolas and San Clemente Islands, California.¹— This 'Report' forms the first of a series of papers giving the results of the work of a scientific exploring party to the southern Santa Barbara Islands, sent out by the Pasadena Academy of Sciences, in charge of Mr. Grinnell, and mainly through the generosity of Mr. Halett C. Merritt. It also is noteworthy as forming the first brochure of this young Academy. Mr. Grinnell was assisted in his ornithological work by Mr. Horace Gaylord. The report is based on the field notes of the party and on a collection of 450 birds' skins and many eggs, and consists of four separate lists, as follows: (1) 'The Land-Birds observed [May 13-18] on Santa Barbara Island,' numbering 14 species; (2) 'Land-Birds observed [May 19-26] on San Nicolas Islands,' numbering 9 species; (3) 'Land-Birds observed [May 29-June 7] on San Clemente Island,' numbering 25 species; (4) Entire list of Water-Birds observed,' numbering 24 species. These lists are quite fully annotated, and give much interesting information regarding the breeding habits of many of the species observed. One new species (*Pipilo clemente* Grinnell, described in this journal (Vol. XIV, p. 294), was secured, and it is suggested that the Rock Wren observed on San Nicolas Island is worthy of separation from the mainland bird "as a new species." The trip was made during the interval from May 11 to June 9, but the birds observed on a previous trip to San Clemente, March 26 to April 4, are also included. The notes on several of the Water Birds are of special interest. — J. A. A.
